

JavaScript, TypeScript, Java, Python, SQL, C++, Go, HTML/CSS
React, Vue.js, SwiftUI, Responsive UI/UX
Node.js, Express.js, REST APIs Design, Microservices Architecture, MongoDB, Firebase Firestore, Supabase
AWS, Docker, Supabase Edge Functions, Firebase, Git/GitHub, CI/CD Pipelines, Postman
OAuth 2.0 (incl. PKCE), Firebase Auth, Role-Based Access Control (RBAC), JWT
Core Skills: OOP, Agile Methodologies

Major GPA: 3.7

- Built a Kafka-integrated Spring Boot microservice with JPA/H2 persistence, external REST API integration, and Maven-verified transaction processing
-

- Developed a resume-to-job matching system in Python using TF-IDF vectorization, Naive Bayes category classification, and cosine similarity ranking to shortlist candidates for job postings.
-

- Built and continue to maintain a void-detection estimating tool in Java, adjusting the algorithm as new material and shape requirements come up, cutting 50+ hours of manual takeoff time per quarter.
- Built a full-stack AI-powered personal assistant in 3 months, integrating Twilio SMS, Google Calendar OAuth, Grok AI, and Stripe/Plaid APIs, owning both the user-facing interface and backend services.
- Designed and deployed scalable backend services to active users, using a microservices-oriented architecture with Supabase Edge Functions and AWS, while building the corresponding client-facing flows.
- Implemented OAuth 2.0 authentication flows end-to-end and built CI/CD pipelines for automated deployment across cloud environments.
- Built and shipped a secure authentication system (Firebase Auth, role-based access control) in 4 weeks, supporting admin and user permission tiers across the platform.
- Developed advanced Firestore database operations and real-time front-end status tracking for participant management.
- Built and maintained RESTful APIs (Node.js/Express) powering 18 full-stack features end-to-end, from database schema to UI.
- Completed 8 applied backend training projects covering OOP, data structures, and system design.
